

Collaborative Causes Site with Git + GitHub

Here's a basic website project that will also help us understand collaborative software development using GitHub.

- Form a group with 2-3 other students.
- Choose a cause that your group really cares about and put together a small informational website using HTML/CSS trying to convince people to donate to or help out this cause. The site should have at least 3 pages and look as professional as possible
- Before you even begin coding, sketch out what you'd like the website to look like and discuss who will handle each aspect of the site
- Create a Git repo with an index.html file and push it to GitHub. Add your project members as collaborators on the repo
- Create issues for each of the different pages and aspects of the site and assign each to a group member
- Make sure that the commit messages for commits involving each issue reference the issue. For instance, `git commit -m "Menu completed, closes #14"`
