JavaScript DOM Manipulation Exercises

1. Input validation

- Write a program to validate a date input. Given a date (06/15/1990, for instance), make sure that it's in mm/dd/yyyy format when the form gets submitted.

- Continuing with this input validation, add a username and password field. Make sure the user's password is "12345" and the username field is not blank when the form gets submitted.

1. When the user presses a key on your web page, tell them if that key is a letter or a number. This result ("letter" or "number") should be displayed in an H1 on the page.

2. Get familiar with all of the different jQuery selectors http://api.jquery.com/category/selectors
